For governments a net-zero target is one that covers all scope 1 emissions in their jurisdiction. For business it usually covers scope 1 and 2 emissions, although some companies also include some scope 3 emissions. The Science Based Targets Initiative is currently working on a standard for companies. roadmaps, to reduce emissions moREnewable100 (RECs & Offsets) Reach Global Sustainability Goals with Renewable Energy Certificates and Carbon Offsets Trade RECs & Carbon with us Trade Local & International Environmental Attribute Certificates Climate Active Achieve Climate Active Carbon Neutral Certification Net Zero Roadmaps Identify opportunities and build achievable pathways Carbon and Energy Strategy Integrate your carbon and energy strategies NGERS Reporting National Greenhouse Emissions Reporting Grants and Programs Review the latest grants and programs Energy Close Energy Open Energy Energy We offers comprehensive energy services, focusing on efficiency improvements, cost reduction, monitoring, benchmarking and strategic sourcing for sustainable and positive environmental impacts Grants and Program Review the latest grants and programs Energy Audit & Assessments Identify cost and emissions reductions Energy Optimisation Metering & Monitoring, Feasibility Studies, EnMS and ISO50001, & Benchmarking Strategic Energy Sourcing Feasibility & Assessments: Renewables, PPAs or Certificates Compressed Air Services Air Compressor Leak Audits, Surveys and Benchmarking EEO Assessments (SG) Singapore Energy Efficiency Assessments Energy Procurement Navigate energy markets with confidence Virtual Environmental Manager Leverage our teams wide experience Certificates Close Certificates Open

Certificates Our Environmental Attribute Certificate services help businesses accelerate technology adoption, improve project ROI, and manage claims of renewable energy, energy efficiency and carbon offset 1 carbon offset = 1 tonne of CO₂-e avoided or removed from the atmosphere. Avoided emissions covers activities that alter behaviour that would have otherwise caused emissions such as energy efficiency improvements or avoided deforestation. Removal covers activities that permanently remove CO₂ from the atmosphere such as new forestry plantations, soil carbon improvement or carbon capture and storage.

[Where's the value in renewable heat?](#) [Craig Morgan](#) August 24, 2026 [Articles](#) Share this article Most renewable heat conversations start with a technology question: heat pump, biomass, biogas, or electrify the whole boiler? It's the wrong starting point. The full value won't be captured if you don't align four things that companies often treat separately: the business case, the funding available, the delivery partner, and the revised strategy on how you buy and use energy. The market is moving faster than the models [Batteries connected to the wholesale market](#) can no longer be ignored – they are affecting project decisions on C&I; sites. They're starting to change how the wholesale market sets prices, and that has direct implications for the assumptions behind ETES, e-boiler, heat pump and broader electrification projects. If your business case still runs on a historically stable electricity price, it's worth asking how confident you really are in that number. [Certificates can be a certain income stream, not a footnote](#) [Income from Environmental Certificate markets can shift a business case significantly.](#) Whilst they introduce some complexity, treating them as an afterthought – something to check once a project is already committed – is too late. Which certificates matter right now, which schemes and methods are right for you, and how much are they worth are exactly the kind of detail that's needed to make the business case work. The bill isn't as fixed as it looks All three major components of an energy bill can be changed materially following an energy transition project. For large energy users, environmental and network charges on the bill can be treated as a fixed cost of doing business. They're not always. Some of what shows up on the bill is more negotiable, more controllable, or more sensitive to how and when you use energy than it first appears. Network charges have historically been stable. But in support of the energy transition, there are new tariffs that support large flexible electrical loads. These can change the future bill structure and save money while helping you to decarbonise. Energy prices are volatile, and energy contracts are becoming more flexible. Getting a new retail supply contract that aligns with the new equipment, the revised network tariff, and new way to buy environmental certificates will set your project up for success. Connect the case, not just the technology We've seen people struggle to strongly connect the engineering assessment with the funding, certificates and energy market knowledge. This is lost value. That's the thread running through our stand this year: one team, every option, the real numbers. Compare every pathway. Connect engineering, funding and certificates, and market knowledge. Capture the value that's usually left on the table.
